

## ZERO EMISSIONS FOR SACBO CAR FLEET

SACBO has adopted the electric car, which it has chosen as a part of its personal fleet of service vehicles. These are intended for use both in the airport and on city streets.

The model selected was a five-door, four-seater vehicle, with a range of 150 km. It is equipped with a lithium ion battery with a standard charge time of 8 hours at 220v, and the possibility of a fast charge of 30 minutes. The charging stations have been created within the parking lot of the SACBO administrative offices in Grassobbio. SACBO made an ethical choice in adopting an Electric Mobility Plan to help lower CO<sub>2</sub> emissions and offer a vehicle that guarantees efficiency and safety for frequent use but for trips that, on average, are short. To identify the selection, the SACBO logo will appear on the front doors of the company service vehicles, on a green background along with the words “Green Energy” and accompanied by the electric car symbol.

The first four service vehicles began operating at the end of 2016, and were assigned to operations on and off the airport grounds. One of them is used as a service vehicle for carrying out SACBO General Service tasks and for trips to the outskirts of Bergamo.
